A LEGEND IN EVERY CORNER OF THE WORLD

Vibram is the world leader in the production of high performance rubber soles for the sports, industrial, dress, leisure, orthopedic and repair markets.

In 1935, Italian Alpine Club member Vitale Bramani was part of an expedition on Resica Mountain where six climbers lost their lives, due in part to their low-quality footwear. Upon his return, Bramani had the brilliant idea of prototyping a vulcanized rubber sole. This breakthrough along with the design of the Carrarmato Sole, revolutionized mountain climbing and the footwear world. Thus, Vibram was born.

The Vibram name is an acronym of its founder's name, Vitale Bramani. Over the last 80 years, Vibram has been committed to develop an extensive range of high-performance soling products for a wide range of sport activities and lifestyles. Thanks to ongoing investments in research and development, Vibram has cultivated an international reputation synonymous with quality, performance and safety.

VIBRAM AND REPAIRS

Since the mid-1950s, Vibram has also been a leading player in developing products designed for the shoe repair market.

Every year, Vibram develops soling products with unique designs and compounds specifically intended for repairing all types of footwear. Every day, all over the world, thousands of shoemakers put their trust in Vibram products to guarantee the best results for their customers.

VIBRAM PERFORMANCE

Each new Vibram product is designed for a particular use and engineered to meet three objectives: performance, comfort, and durability.

The secret to Vibram performance lies in the combination of an innovative, functional design, and the compounds we use.

VIBRAM DESIGN

Vibram designers are not only experts in appearance, they are technical experts trained to evaluate the characteristics each sole needs to have for its intended use.

Vibram designers also work in close collaboration with the Vibram Tester Team and the professional athletes, of the Vibram Team. Our designers use the tester team's feedback when designing new product for specific applications.

Designers also collaborate with many biomechanical research institutes in order to identify new lines, volumes and forms, all with the goal of developing functional and comfortable soles while ensuring top performance.

VIBRAM COMPOUNDS

Not one compound is suitable for all physical activities. However, these key characteristics are common to most uses:

- **Resistance** to wear, which is defined as abrasion resistance.
- **Lightness**, which is defined as density.
- **Softness**, which is defined as hardness. Vibram compounds offer a wide range of hardness levels. All levels have excellent wear resistance.
- **Elasticity**, which is measured by the percentage of elongation at break. Some Vibram compounds can stretch as much as six times their original length.
- **Tenacity**, which is measured by stress at break.

Foam Compound

	DENSITY	HARDNESS	ABRASION	TEAR RESISTANCE B METHOD	COMPRESSION SET	HYDRO- CARBONS RESISTANCE	ELECTRIC RESISTANCE	ANTI MICROBIC JIS Z 2801:2000	ANTI FUNGAL

TESTED WHERE IT MATTERS

Before Vibram products reach the market, they are all tested using strict quality controls. We carry out these tests in our SATRA-certified laboratories by certified technicians or directly in the field by the Vibram Tester Team.

Every Vibram sole has to pass three levels of testing to guarantee that the product quality meets the end consumer's requirements.

Lab Tests

- Conducted in a controlled environment
- Physical-mechanical characteristics tested by MACHINES
- Test samples: on soles or sheets.
- Slip resistance, abrasion, elasticity, hardness, density, etc

Laboratory tests are necessary to determine the physical-mechanical characteristics of a compound (resistance to slip, abrasion, elasticity, hardness, density, etc.). These tests can be carried out both on soles and sheet samples.

INSTRON E3000

Designed for dynamic and static testing on a wide range of materials and components in different temperature conditions.

TGA: Termogravimetric Analysis

Thermogravimetry is a technique by which the weight variations of the sample are measured as a function of the temperature in a controlled atmosphere. It is mainly used for the determination of the composition of an unknown substance and is applied in the fields of rubber and plastic analysis.

In Vivo Tests

- Indoor Testing on shoes with flat sole design
- Carry out on shoes worn by human beings based on specific scientific protocols (“in-vivo”)
- Test samples: on flat design soles to verify the compound performance
- Trustable compounds comparisons

Field Tests

- Outdoor Testing under the most extreme but real situations
- Blind tests run by the VIBRAM TESTER TEAM
- Test samples on shoes: soles, designs and compounds
- Product is **READY TO MARKET**

TESTED AND APPROVED

CERTIFIED SAFETY AND QUALITY

ISO

Vibram has been certified ISO 9001 (quality) – ISO 14001 (environment) – OHSAS 18001 (safety).

REACH

The **REACH** system – set up by the European Union – is a system for the registration, evaluation, authorization, and restriction of chemicals for the purpose of improving the safeguarding of human health and the environment. By better identifying the intrinsic properties of chemicals, Reach also contributes to maintaining competition and strengthening the spirit of innovation of the chemical industry in Europe.

Vibram has introduced a Restricted Substances Policy for the use of prohibited substances according to the international rules which regulate the type and the concentration of potentially dangerous substances. With respect to Vibram values, the RS Policy goes beyond law obligations and includes also some substances that are not prohibited, but which can be a source of concern for the consumer.

The Policy integrates all REACH directives, associated to Vibram supplied products which “do not release substances during their normal and reasonable use” and which do not contain dangerous substances (SVHC) in quantities exceeding 0.1%.

SATRA

SATRA, the leading worldwide research center for footwear technology, research and development, provides its support and expertise in all stages of product development, from initial research to the evaluation of materials and components, up to and including testing and certification, guaranteeing the highest levels of quality.

Vibram boasts close daily collaboration with Satra, and the laboratories of the Vibram Technological Center in China have Satra certification.

GLUEING THEORY AND TECHNIQUES

As a result of a gradual moving away from sewing and nailing, due to the type of shoe that customers nowadays bring to your laboratories and consequently to the type of sole to use, the knowledge of glueing techniques is **FUNDAMENTAL** for a **Master Cobbler**, in order to provide the best service to your customers, ensuring that the best soles in the world can provide optimal performances in total safety.

To obtain this achievement, Vibram Sole Factor Mobile Lab technicians, in cooperation with technicians from some of the most important producers of glueing procedures, have prepared a list of required processes and guidelines, regardless the brand of the glue, which establish a real working method, tried and tested over the last 4 years.

Steps of processing

- Recognition of the materials which compose the shoe and the sole.
- Preparation of the surfaces to be glued on the shoe.
- Preparation of the surfaces to be glued on the (VIBRAM) sole chosen for resoling/customising.
- Application of chemical primers to both the shoe and the sole.
- Application of glue to both surfaces.
- Reactivation of glues on the surfaces to be glued with a hot air gun or infra-red oven.
- Assembly of the sole and shoe with the use of a cushioned sole press.
- Allowing the adhesives the necessary time to create a permanent bond between the shoe and the sole.
- Trimming, finishing and cleaning of the shoe for reconsignment.

More deeply, we need to take note that the work of the Cobbler begins with an analysis of the shoe to be re-soled and which kind of material is made of, which will be handled throughout the stages of the processing.

Here is a list of the most common used materials:

- **EVA** (commonly known as Microporous) is typically used by many brands as a shock absorber in the intersole for running shoes.
- **PVC** is generally used for the production of soles for acid-resistant work shoes which, over the time, has become a fashion icon.
- **NYLON** is generally used to create inserts of varying levels of elasticity, used above all in sportswear.

- **POLYURETHANES** are generally used for the production of intersoles/heels of sports shoes or for the production of mid/low-range shoes. If exposed to particular weather conditions, the phenomenon of hydrolysis can occur, which causes the crumbling of the soles.
- Various **THERMOPLASTIC** materials such as polyethylene, polypropylene etc. are used for the production of inserts and parts of high-range sports shoes.
- **RUBBER** typically used for the production of soles and crepe sheets.
- **PARA**, a derivative of solidified rubber latex, it is used for the production of some soles.
- **LEATHER**
- **HIDES**

After identifying the types of materials that can be typically re-soled, let's examine the main compounds which have recently been developed and that at Vibram, we love defining as **TECHNOLOGIES**.

MEGAGRIP

A compact rubber which guarantees maximum grip in **OUTDOORS** sports activities, above all in the wet conditions.

ARCTIC GRIP

A soft rubber which guarantees durability, associated with special inserts in loaded rubber which guarantee the best possible grip on wet ice.

XS CITY

A mid-softness rubber which, as well as durability, guarantees utmost grip on urban surfaces, above all in wet conditions.

LITE BASE

A combination of a synthetic support and **MEGAGRIP** rubber allow for soles which are 30% lighter without renouncing in terms of duration or grip on wet surfaces.

Below you will find the methods used by Vibram Sole Factor Mobile Lab technicians on 4 recently-developed technologies.

Before moving forward, we would like to emphasize that:

- **Primer** refers to any substance used to prepare the surface to be glued.
- **Activators or cross-linking agents** are substances which increase the reaction speed of the glueing process, if added in a precise percentage, generally recommended by the manufacturer
- **Carding and/or scraping** the surfaces to be glued, as well as removing any impurities, increases the surface on which the glue will act, thus improving the final result. This operation is always carried out with appropriate equipment, according to the type of surface to be treated.

Taking these assumptions in mind, here few simple instructions for obtaining the best results with 4 of our new technologies.

MEGAGRIP

- treat the surface of the sole with a **polychloroprene primer for EVA/SBR-based expanded materials**, adding **9% polyisocyanate cross-linker for solvent adhesives** after 25 minutes;
- apply a single-component **polyurethane adhesive**, again with the addition of **9% polyisocyanate cross-linker for solvent adhesives**.

After 20 minutes reactivate the surface with heat (hot air gun or IR oven) and press

ARCTIC GRIP

- treat the surface of the sole with a **polychloroprene primer for EVA/SBR-based expanded materials**, adding **9% polyisocyanate cross-linker for solvent adhesives** after 25 minutes;
- apply a single-component **polyurethane adhesive**, again with the addition of **9% polyisocyanate cross-linker for solvent adhesives**.

After 20 minutes, reactivate the surface with heat (hot air gun or IR oven) and press.

XS CITY

- Treat the surface of the sole with a **chlorination agent for vulcanised rubber** after 45 minutes;
- apply a single-component **polyurethane adhesive**, adding **9% polyisocyanate cross-linker for solvent adhesives**.

After 20 minutes reactivate the surface with heat (hot air gun or IR oven) and press.

LITE BASE

- For information regarding soles in **Vibram LITE BASE**, please consult the dedicated guide “**HOW TO LITE BASE**” which is available on request from your dealer or directly from **Vibram S.p.A.** via the following e-mail address: **Vibram@Vibram.com**.

Please remember that:

When using a chlorination (halogenating) agent for vulcanised rubber and TR, a polyurethane glue must always be used. On the contrary, when a polychloroprene primer for EVA/SBR-based expanded materials is used, polychloroprene-based adhesives can also be employed.

LITEBASE

LIGHTNESS WITHOUT COMPROMISE

Vibram LITEBASE Tech - drastically reducing thickness and weight far rubber outsoles, and fully maintaining the grip and traction expected from Vibram.

This new technology drastically reduces base thickness up to 50% tram an identical sole design, (tram 1.7 mm to 0.5/0.9 mm depending on the type of sole) and allows the overall weight to be reduced up to 30%.

Vibram LITEBASE Tech offers the ultimate lightweight solution far high performance footwear; sacrificing nothing in performance, grip and traction.

MEGAGRIP

GROUNDBREAKING GRIP

UNPARALLELED PERFORMANCE ON ALL TERRAIN IN WET AND DRY CONDITIONS.

ALL-TERRAIN. ALL CONDITIONS. THIS IS MEGAGRIP.

Vibram MEGAGRIP offers excellent grip properties on both dry and wet terrains while maintaining a higher level of durability. Developed for the user who frequently encounters slippery surfaces, Vibram MEGAGRIP is suitable for trekking and multisport as well as all season hiking and travel. MEGAGRIP offers an incomparable combination of grip and durability which helps define Vibram MEGAGRIP as the ideal high performance rubber compound for extremely demanding activities such as backpacking, canyoneering, endure - mountain biking and skate boarding.

Available in soft (65/70 Shore A) and firm (75/80 Shore A) hardness formulas, Vibram MEGAGRIP is moldable in a variety of outsole shapes and patterns designed to meet a large range of end user's needs.

- Unparalleled grip on wet and dry surfaces
- Rugged longevity
- Optimal ground adaptability

ARCTIC GRIP
WET ICE TECHNOLOGY

WET ICE TECHNOLOGY

THE MOST ADVANCED COLD WEATHER GRIPPING SYSTEM EVER CREATED BY VIBRAM.

Innovative Technology specifically engineered and designed to perform on wet ice. Unique polymer blend coupled with an advanced filler system and new processing technique. Paired with Vibram Icetrek, which yields Vibram's best grip on dry ice. Vibram Arctic Grip offers Vibram performance, quality and durability

BENEFITS

Specifically engineered and designed to perform on wet ice

Vibram performance, quality, durability

Improved grip on cold, iced, or snowy surfaces compared with existing Vibram soles.

WARNING

This product will not prevent slipping on any surface. **ALWAYS TREAD WITH CARE.**

This product does not replace use of spikes.

This product is not intended for use on, and may harm, indoor surfaces.

XS CITY

MAXIMUM ANTISLIP ON URBAN WET SURFACES.

The Vibram XS City Compound has been formulated to provide the best grip on wet typical urban surfaces.

This high level of grip on wet allows a safe walk even on smooth marble and metallic floors. It provides good cushioning level for comfort during urban walk.

- Distinguished grip on city environments
- Safe walk on wet
- Optimal compromise between durability and grip
